Sous-échantillon : 1 035 observations

This graph provides an overview of the statistical results from observation sessions conducted at nine stations in the Hauts-de-France region. Among 10 observed intermodal users, 7 of them are **male**. This suggests that cyclists who are classified as **'female'** are in the minority. However, among the 15,435 travelers observed, women represent 48.71% of the station passengers, indicating **a significant underrepresentation of women** within the social group of individual light mobility users combined with the rail network.
