Reading Guide

Sample: 217 responses

The ranking of reasons for adopting intermodal practices among intermodal cyclists who participated in the survey follows different logics depending on the modes of transport.

Overall, the top-ranked reasons relate to distances being too long to walk (E), flexibility (G), and environmental concerns (F). Issues related to the limited range of walking and flexibility are notably mentioned by users of both KICK and electric scooters, while environmental concerns are mainly identified by users of classic bikes. Fuel costs are more represented in the adoption of electric scooters, while curiosity for shared mobility and sense of freedom are more associated with classic and folding bike users.
