Walking

Scale

Sample: 318 stations and pedestrian isochrones (*PI*)

The radar chart, inspired by the butterfly diagram, represents **the 40 explanatory indicators** and the independent variable based on **the annual station attendance**, studied within the **NPART** model. It shows the normalized average value of each variable, **with equal weight**, describing the state of the 318 stations and station neighborhoods examined in the Hauts-de-France region, at the **Pedestrian Isochrone** scale (PI). It is important to note that this chart focuses on station attendance during **weekdays, between 6AM and 10AM** (RT_2).
