Walking Scale Sample: 318 Pedestrian Isochrones (PI)

The *Pearson* correlation matrix, relating each of the indicators integrated into the model, represents **their respective influence**, on average, across the 318 isochrones generated at the pedestrian scale (*PI*). On one hand, this graph shows the presence of **29 positive associations**, with a regression coefficient greater than or equal to 0.80. On the other hand, **2 negative associations**, with a regression coefficient less than or equal to 0.70, are observed in this series of statistical regressions.
